

Fitness FAQ

Training FAQs

Q: How often should I train each muscle group? A: Roughly 2x per week per muscle group is generally more effective for growth than once weekly at equal total volume.

Q: Should I do cardio before or after lifting? A: If strength/muscle is the priority, lift first while fresh; do cardio after or on separate days.

Q: How long should a workout be? A: 45-75 minutes including warm-up is typical; quality and progressive overload matter more than duration.

Q: Is soreness required for a workout to 'count'? A: No - soreness is not a reliable indicator of effectiveness; consistent progressive overload is what drives results.

Nutrition FAQs

Q: Do I need to eat immediately after training ('anabolic window')? A: Total daily protein and calories matter far more than precise timing; eating within a few hours of training is sufficient for most people.

Q: Can I out-train a bad diet? A: Generally no - diet has a larger effect on body composition than exercise alone, since it's easier to overconsume calories than to burn them off.

Q: Is intermittent fasting necessary for fat loss? A: No - it's one of several strategies to help create a calorie deficit; total calories over time remain the primary driver.

General FAQs

Q: How long until I see results? A: Visible changes often take 4-8 weeks of consistent training and nutrition; strength gains can appear within 2-4 weeks as the nervous system adapts.

Q: Is it normal to hit plateaus? A: Yes - progress is rarely linear; adjusting volume, intensity, or calories, and ensuring adequate recovery, typically restarts progress.

Q: Do I need a gym membership to get results? A: No - bodyweight and minimal-equipment training can build strength and improve body composition, especially for beginners.
