

Stretching & Mobility Guide

Static vs Dynamic Stretching

Dynamic stretching (controlled, moving stretches like leg swings, arm circles) is generally preferred before training to warm the muscles and prepare joints for movement.

Static stretching (holding a stretch, e.g., 20-30 seconds) is generally better suited after training or on rest days, when it does not appear to reduce force output.

Common Mobility Drills

Drill	Target Area	Reps/Hold
Cat-Cow	Spine mobility	8-10 reps
World's Greatest Stretch	Hips, thoracic spine, hamstrings	5/side
90/90 Hip Switch	Hip internal/external rotation	8-10/side
Shoulder Dislocates (band/stick)	Shoulder mobility	10-15 reps
Ankle Dorsiflexion Rock	Ankle mobility	10/side
Couch Stretch	Hip flexors, quads	30-45s/side

Pre-Workout Warm-Up Template

5 minutes light cardio (jog, bike, jump rope) to raise core temperature.

5-8 minutes dynamic mobility targeting the day's main muscle groups.

1-2 light warm-up sets of the first exercise before working sets.

When to Prioritize Mobility Work

Persistent tightness limiting range of motion in a lift (e.g., ankle mobility restricting squat depth) is a good signal to add targeted mobility work 3-4x/week.

General mobility maintenance (10-15 min, 2-3x/week) supports long-term joint health and movement quality even without a specific limitation.
